

Digital Display Software

Alertus Digital Display Software disseminates emergency alert notifications to digital signage and network computers by maximizing a full-screen window. Audible tones and voice messages can be activated, if the displays are equipped with speakers.

The activation process is fast. Simply customize or select a pre-scripted message, select the dissemination area, and designate the duration. Messages can then be canceled anytime. The displays can be individually addressed and zoned geographically and categorically.

Alertus Digital Display Software is typically configured to display your organization's logo in the top left. Red text flashes "Alert!" in the center of the screen while a message scrolls instructing everyone of the nature of the emergency and how to respond.

Benefits

- Reliable** | not dependent on external internet connections
- Zoneable** | Localized information where/when needed
- ADA Compliant** | warns deaf and hard-of-hearing individuals
- Instantaneous** | no throughput delays
- Scalable** | easy to deploy
- Cost Effective** | no recurring service fees

Alertus Digital Display Software ties in seamlessly with wall-mounted Alert Beacons (right). Also, the software can be customized to control LED marquees and override cable TV systems.
